An investment in Knowledge pays the best interest….

JDBC (PART 14)

What is metadata ?

- Data about data is known as metadata.
- It means it is a description and context of the data
- It helps to organize, find & understand the data
- For example:- While clicking any image through phone camera, lot of data is stored like file name, file size, date & time, camera settings etc

Types of metadata:

- ResultSet Metadata (ResultSetMetaData - interface)
- Database Metadata (DatabaseMetaData - interface)

(These 2 interfaces are provided by Sun Microsystems but these implementation are provided by database vendors)

ResultSetMetaData :-

- It is used to get metadata of the table like total no of column, column name, column type.
- We get ResultSetMetaData metadata by using ResultSet object
- Methods :-

  1. getColumnCount()

2. getColumnName()
3. getColumnTypeName()
4. getTableName()

DatabaseMetaData :-

- It is used to get metadata of the database for eg database product name, database product version, driver name, total no of tables etc.
- To get database metadata we have to use Conneciton object
- Methods :

1. getDriverName()
2. getDriverVersion()
3. getUserName()

4. getDatabaseProductName()

5. getTables()

Date & Time

- Using Date Class (java.util) - JDK 7 or below
- Using Calendar Class (java.util) - JDK 7 or below - Prefered
- Date/Time API - JDK 8 or newer version

-> LocalDate

-> LocalTime

-> LocalDateTime

- 4. Date using SQL package (JDBC)
