An investment in Knowledge pays the best interest….

JDBC (PART 20)

JoinRowSet :-

- It is disconnected RowSet
- Its main motive is to join two RowSet objects content into single RowSet object

- We have to get the content form two tables but both tables should have atleast one common column

---

RowId :-

- It is an interface present in java.sql package
- It was introduced in JDBC 4.0 version

- rowid (for database) - rowid is default logical address generate by database (like oracle)
- All databases does not create this unique address or value like MySQL
- Programmer is not responsible to generate this rowid

RowIdLifetime (enum)

⇨ Enum : It is a group of named constants.

```
enum MyColors
{
    RED, GREEN, BLUE
}
class
{
```

```
}
```

⇨ enum can be created within a class or outside the class

⇨ enum RowIdLifetime

```
{
    ROWID_UNSUPPORTED,
    ROWID_VALID_SESSION,
    ROWID_VALID_TRANSACTION,
    ROWID_VALID_FOREVER,

    ROWID_VALID_OTHER
}
```

⇨ ROWID_UNSUPPORTED - MySQL

- ROWID_VALID_FOREVER - Oracle

- If we want to find RowIdLifetime then we have to use DatabaseMetaData
