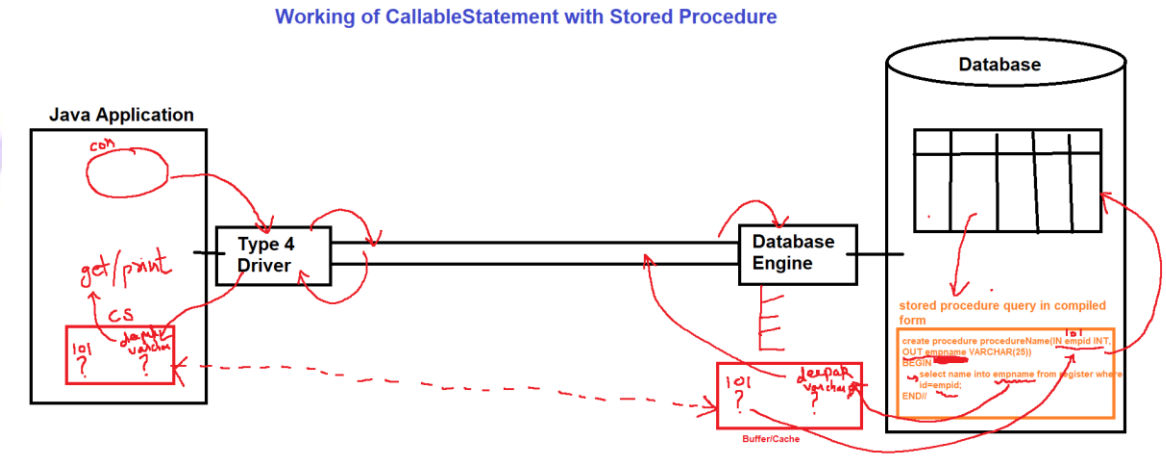
JDBC (PART 8)

⇨ Working of CallableStatement



⇨ Stored Functions:

A stored function is a set of SQL statements that perform some operation and return a single **value**. Just like Mysql in-built function, it can be called from within a Mysql statement. By default, the stored function is associated with the default **database**.

⇨ Difference between Stored Procedure & Stored Functions

1. STORED PROCEDURE doesnt have any return value. But it returns value using the OUT parameter

   STORED FUNCTION has a return type and returns the value

2. STORED PROCEDURE can be used with all DML queries i.e. insert, update, delete, select etc..

   STORED FUNCTION can be used only with select query

3. STORED PROCEDURE can have both IN (input) & OUT (output) type

parameter

STORED FUNCTION cannot have OUT (output) parameter

4. We can call stored function from a STORED PROCEDURE

We cannot call stored procedure from a STORED FUNCTION

⇨ **Points To Remember**

- According to documentation return value can be in the form of STRING, INTEGER, REAL, DECIMAL

- If you want to read a select ResultSet then you should use stored procedure, not stored function

⇨ **Stored Functions Queries**

To see all available functions

SHOW FUNCTION STATUS;

To delete any stored function

DROP FUNCTION function_name;

To create stored function without Parameter

```
DELIMITER //

CREATE FUNCTION getAvgSalary()
RETURNS INT
    BEGIN
        DECLARE avgsalary INT DEFAULT 0;
        SELECT AVG(salary) INTO avgsalary
                FROM salary;
        RETURN avgsalary;
    END//
```

To create stored function with parameter

```
DELIMITER //

CREATE FUNCTION getEmpName(empid INT) RETURNS VARCHAR(20)
BEGIN
    DECLARE empname VARCHAR(20) DEFAULT "";
    SELECT name INTO empname FROM register WHERE id=empid;
    RETURN empname;
END//
```
